Local bone antibiotic delivery using porous alumina ceramic: clinical and pharmacological experience

E. Denes, F. Fiorenza, E. Toullec, F. Bertin, S. El Balkhi
Limoges, France
Context

- Replacing infected bone
- High risk of implant's infection
- => No foreign body during infection

Proposition:
- Implantation of a "protected" device (antibiotic loaded)
- Prophylaxis
The ceramic: main characteristics

- Pure alumina $\text{Al}_2\text{O}_3$
- Proven biocompatibility, inert
- Mechanical strength more than 20 MPa
- Non absorbable
Antibiotics

- Antibiotic loaded:
  - Gentamicin
  - Vancomycin
  - Both of them

- Release: 100 %
- Start of release: immediately
- Release duration: 48 – 72 h (in vitro)
Four patients received this loaded sternum
More than 3 years of follow-up for the 1st one without relapse
Chronic osteomyelitis (MRSA)

All samples grew with MRSA

Follow-up

Loaded with gentamicin

M11

M17

M11
Chronic osteomyelitis: femoral tile

Man 64 year-old
Chronic osteomyelitis – MSSA
Evolution: 30 years
Gentamicin cement beads

Gentamicin loaded
X-Ray follow-up M3
**Local dosages**

Surpassing resistance

Mediastinitis

Bacteriological sampling and sensitivity interpretation
EUCAST

*K. pneumoniae*

- **gentamicin S** (MIC = 1 µg/mL)

**MRSE**

- **gentamicin R** (MIC = 384 µg/mL)
  - EUCAST Breakpoint: 1 µg/ml
- **vancomycin R** (MIC = 8 µg/mL)
  - EUCAST Breakpoint: 4 µg/ml

Administration route

Intravenous

⇒ Expected to fail (MRSE)

**Locally** (MRSE)

- Gentamicin
  - $C_{\text{max}}$/MIC = 17
- Vancomycin
  - AUC/MIC = 16,000

⇒ Expected to be efficient
  - M+2 : no relapse
**In vivo – blood concentrations**

- **Very low and undetectable blood passage**
- **Decreasing side effects and toxicity**
